Data Visualization and Storytelling:-

Project Title: Sales Are Not the Same as Profit
Tool Used: Tableau Public
Dataset: Sample Superstore

1. Context

The objective of this project is to analyze sales and profitability across product categories and sub-categories using Tableau.

2. Problem

High sales do not necessarily mean high profit. The business needs to understand which product categories and sub-categories contribute most to profit and which may require improvement.

3. Evidence

The Tableau dashboard presents three visualizations:

- **Sales by Category:** compares sales across product categories.
- **Category Sales and Profit:** compares sales performance with profit.
- **Profit by Sub-Category:** highlights differences in profitability among sub-categories.

Insert your Tableau dashboard screenshot here. Use the actual chart results to support your observations.

4. Recommendation

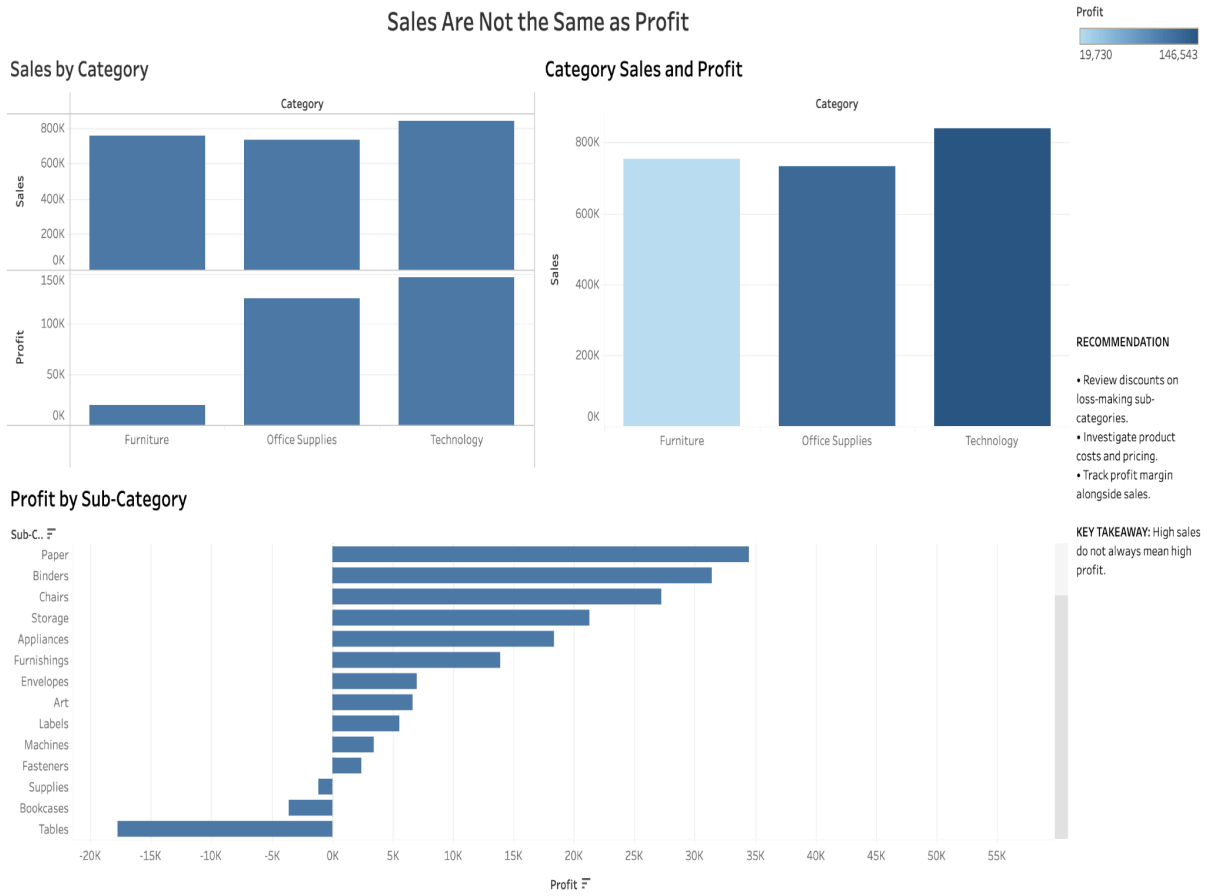

- Focus on product categories and sub-categories that generate strong profits.
- Investigate low-profit or loss-making sub-categories before increasing sales efforts.
- Review pricing, discounts, and costs to improve profitability.
- Use both sales and profit metrics when making business decisions.

5. Conclusion

This dashboard demonstrates why sales and profit should be analyzed together. Tableau visualizations help identify business performance patterns and support data-driven decisions.

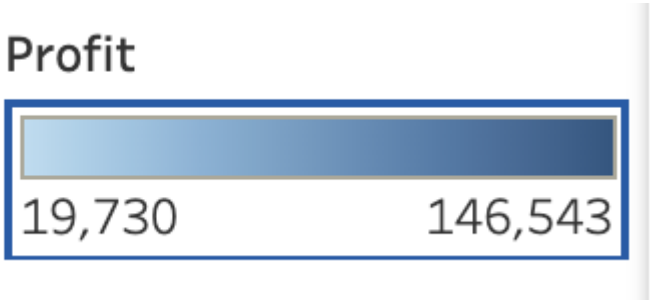

Published Tableau Dashboard:

Overall Finding: The dashboard brings sales and profitability together to provide a clearer picture of business performance. It helps identify opportunities to improve profits rather than focusing on sales alone.

1.Category Sales and Profit:-
Compare the sales and profit bars for each category.

Observation: Comparing sales with profit helps identify whether high-selling categories are also generating strong profits. The business should consider both metrics when evaluating category performance.

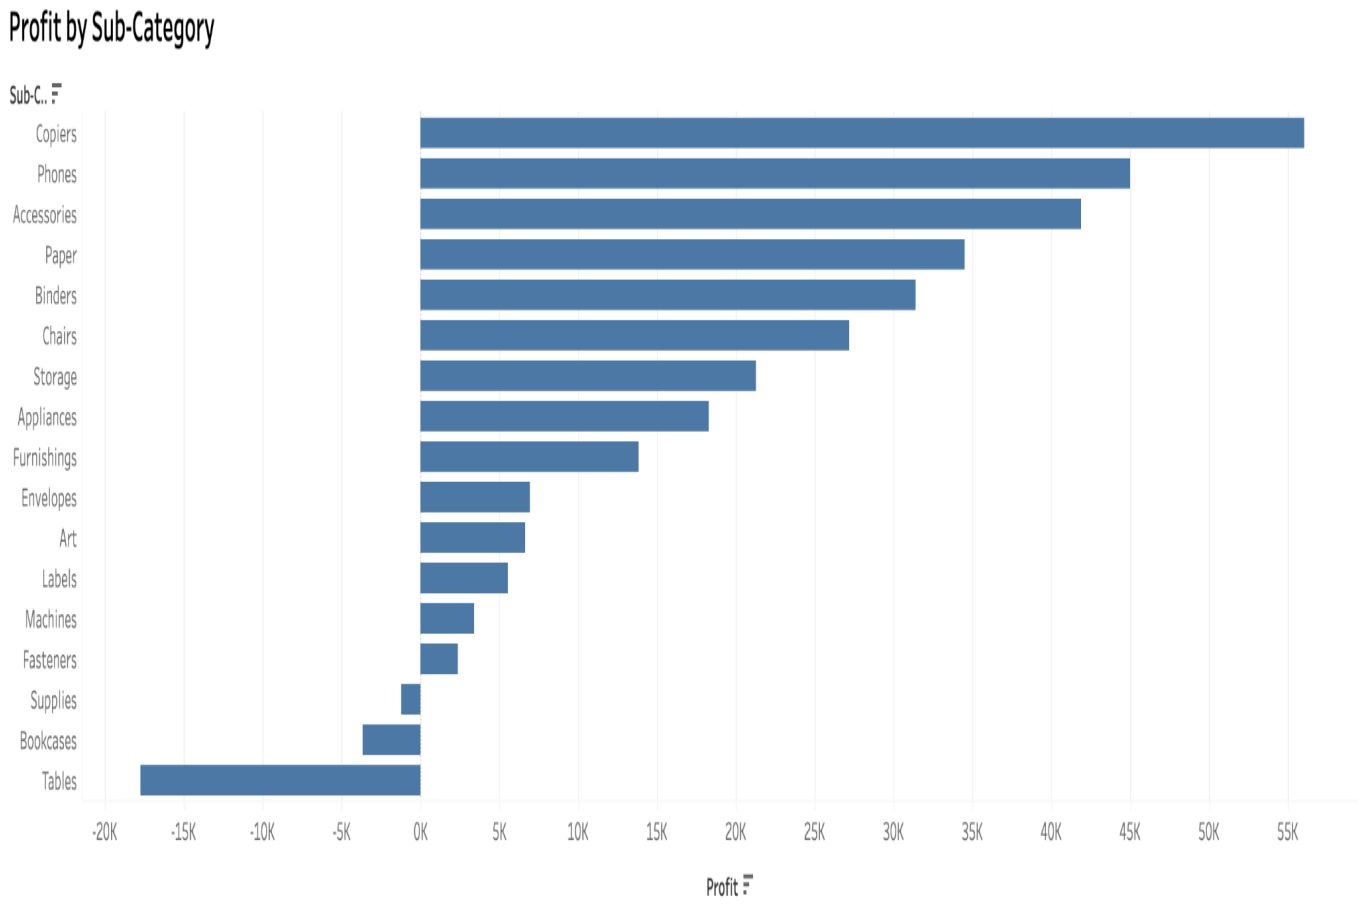

2.Profit By Sub-Category:-

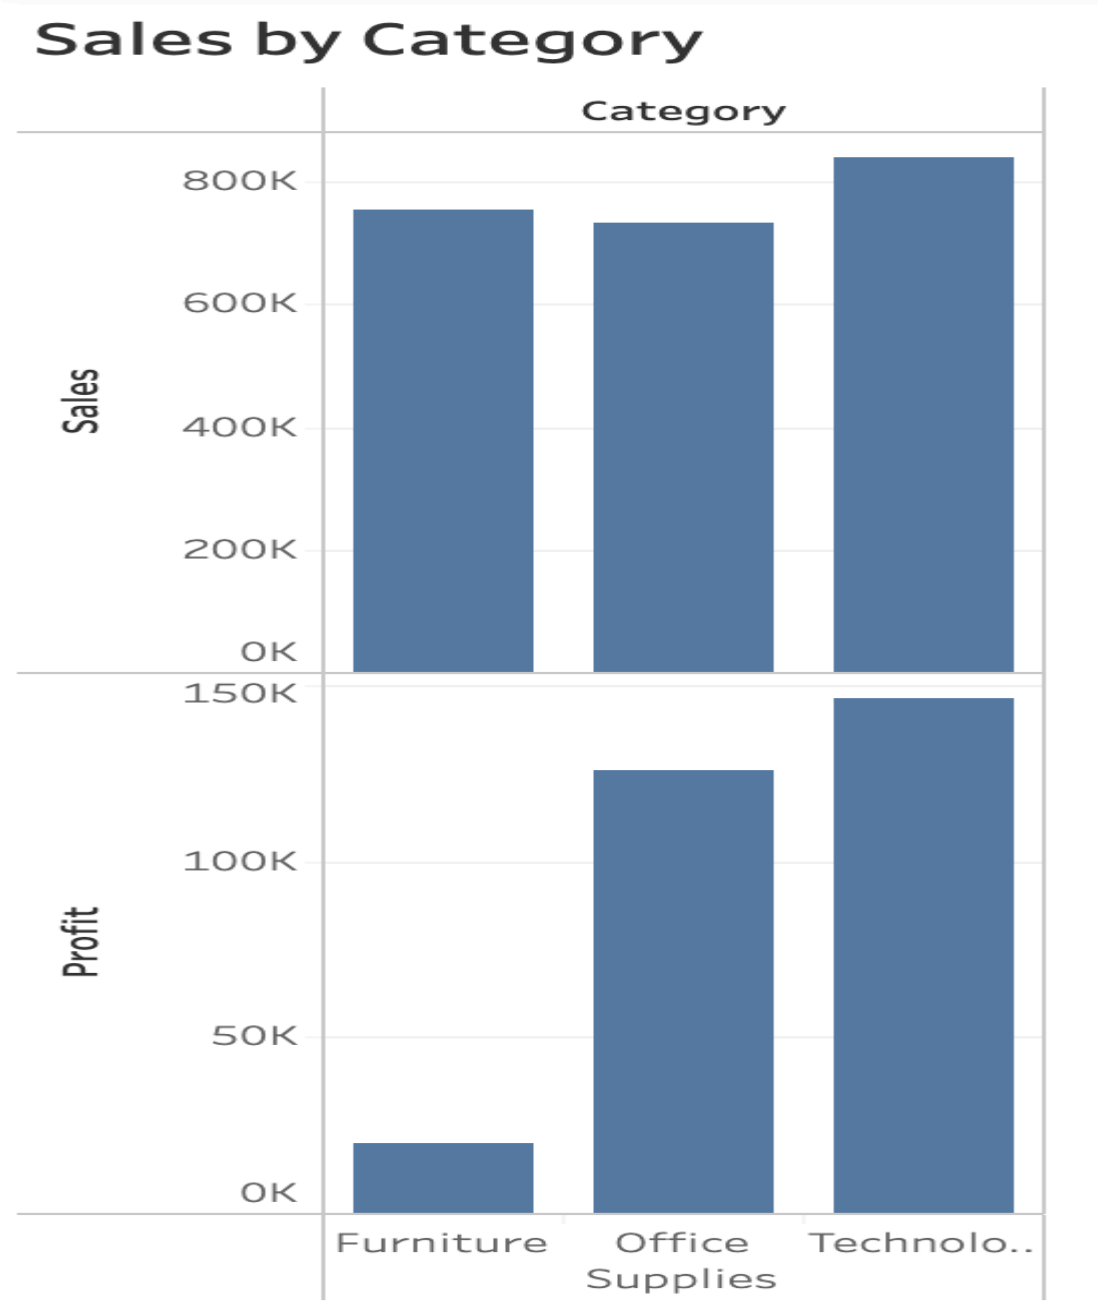

Look for sub-categories with the highest profit and those with low or negative profit.

Observation: Profit varies across product sub-categories. Identifying the strongest and weakest performers can help the business decide where to focus its efforts and which products may need pricing or cost adjustments.

3.Sales By Category:-
Look at the chart and identify which category has the highest sales and which has the lowest sales.

Observation: This chart compares sales across different product categories. It helps identify the categories generating the highest and lowest sales, allowing the business to understand customer demand.
